

[Virtual machine setup](#) > [Installing sudo & configuration of user and groups](#)[Copy](#)

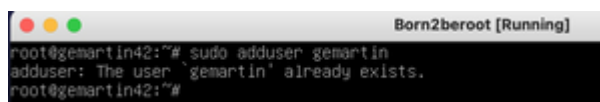

Creating a user

Now, this step is for the everyone that didn't put his user as the other user asked by the subject during the installation of the system.

Still in the root user we will create an additional user with

```
sudo adduser <login>
```

If you had already done it will show the same message as is the image.

```
Born2beroot [Running]
root@gemartin42:~# sudo adduser gemartin
adduser: The user 'gemartin' already exists.
root@gemartin42:~#
```
