

Virtual machine setup > Installing sudo & configuration of user and groups

Copy

Creating a group

1. We will create a new group called `user42`. For that we must use:

```
sudo addgroup user42
```

It will show this:

```
gemartin@gemartin42:~$ sudo addgroup user42
Adding group `user42' (GID 1001) ...
Done.
gemartin@gemartin42:~$
```

What is **GID**? It's the group identifier, in short, Group **ID**.

2. Was the group created without problems? Truth is that there is no sign of one, still we can check it using with:

```
getent group <groupname>
```

And see all groups and the users in any of them.
