

Adding a user to a group

How to add users to groups

1. **Add user to group:** We can add a user to a group using the `adduser` command with this syntax:

```
sudo adduser <username> <groupname>
```

For our Born2BeRoot project, we need to add our user to both the `sudo` and `user42` groups:

```
sudo adduser gemartin user42
```

```
sudo adduser gemartin sudo
```

Replace `gemartin` with your actual username.

2. **Verify group membership:** Once completed, we can verify the user has been added to the groups using:

```
getent group sudo user42
```

This command will show the groups `sudo` and `user42` with our user listed as a member.

```
sudo:x:27:gemartin
```

```
user42:x:1001:gemartin
```
